3. MARKET ANALYSIS

3.1 MARKET TRENDS

Our company is bolstered by several market trends that greatly increase the demand of the business's products and services.

Singapore Green Plan 2030 – Our offerings are firstly aligned with the government's push for a greener and more sustainable Singapore by 2030. One of the key objectives is having Greener Infrastructure and Buildings where the government seek 80% improvement in energy efficiency. Particularly, air-conditioning is the single biggest contributor to energy consumption in any commercial and residential building in Singapore, attributing to 19% of Singapore's total carbon emission.

Innovations like ours, that can reduce the energy consumption of air-conditioning, will therefore have huge value in the market, especially since the government has enacted legislation and even given monetary subsidiary to encourage business owners to adopt higher energy efficient practices. Also, in terms of consultation service, our extensive experience in green building and involvement in numerous

large green building constructions, including creating the highly innovative 'sponge city', gives us the credentials to provide valuable green building inputs to governmental agencies and private contractors.
